

The Logic of Volcano Vaporizers

The best thing behind the logic of volcano vaporizer is that it works on the principle, inhale comfortably without smoke. It is the newest development in the area of vaporizer technology. It offers most freedom of movement while smoking from the vaporizer as compared to other old vaporizers. Balloons used in this vaporizer make this unmatched freedom possible. Balloons can be totally detached from the vaporizer itself we enjoy our herbs or favorite plant extract smoking blend. We can inhale from the Vent-Balloon when required, without taking notice of the burn process itself of the vaporizer device. The process of vaporizing the smoking blends/herbs is made possible by the special membrane pump inside the vaporizer. Particularly designed heat dispenser makes it very easy and without any attention from the user, to fill the balloon the most efficient and effective way possible. User can just relax and sit back to see, while the precious mist builds inside the transparent balloon.

Along with its superb functionality the vaporizer is also famous because of its quality and reliability. It is believed to be the best vaporizer in the world. More over, its design makes it also pleasing for the eye. This vaporizer is manufactured only from first class materials and components and is assembled by hand only. All quality requirements are met by the standards used in the medical world, which is one of the most quality and fool proof driven in the world. We can use this device to vaporize substances, including eucalyptus, hops, chamomile, lavender, lemon balm, sage, thyme, as well as other herbs and liquids. Rather of combusting the material, the volcano vaporizer pumps release very hot air heated with an aluminum heating element through the substance, which causes the release of the herb's active ingredients.

These vaporizers are medical-grade devices intended to vaporize the active and/or aromatic compounds of herbs without allowing combustion. It is used to release those compounds from a wide variety of herbs, including cannabis, for medical purposes though the device has also become popular for recreational use. Earlier the design used an electromechanical control system and could be adjusted to produce temperatures ranging from 130 °C to 226 °C. It was high enough to release the active substances and aromas, but insufficient to cause the material to combust. Volcano vaporizers use a heat-resistant oven bag with an attached check valve to hold the vapor. When the balloon is filled it is removed from the chamber and the mouthpiece is attached for vapor inhalation. A different model known as Easy valve was designed to provide simpler operation and greater efficiency over the original valve design. Its design featured a disposable balloon/mouthpiece assembly which allowed users to avoid the occasional cleaning required in the original design.
